Stonewater Leads Demand Side Management

Stonewater offers energy providers and transmission operators a turnkey solution for large-scale demand side management.

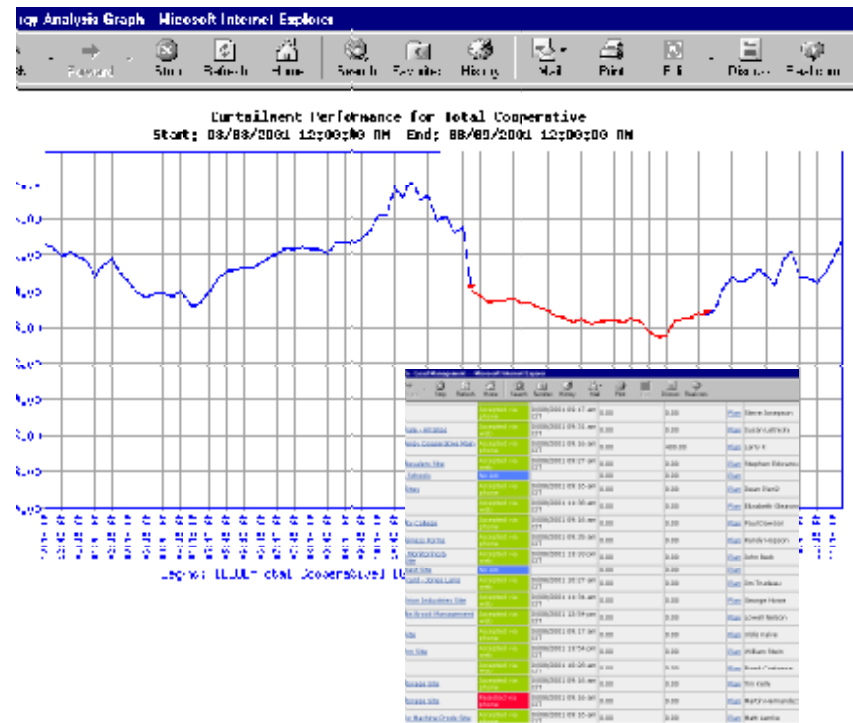

Through customer communication and control of energy consumption, utilities enhance grid reliability, lower costs and realize positive customer relationships. Utility customers receive a powerful tool to create and implement an energy reduction strategy.

The Stonewater platform supports all types of demand-side management programs: interruptible, price-based, voluntary or mandatory.

The service coordinates and monitors program participation in real time. Program administrators initiate notification to program participants, monitor message delivery and participant response, and verify real-time load reduction.

Stonewater has worked with major utilities to implement customized demand-side management programs that meet utility and customer needs.

Stonewater offers custom-branded sites that bring utilities and their customers together. There is no IT equipment to purchase, and the customer interface is intuitive and easy to use.

Utilities track curtailment performance over the Internet.

Georgia Power selected Stonewater's solution to improve their communication with their Demand Response Program customers and to secure a more scalable web-based solution for program expansion.
